Projects

Python GUI Course Registration Project

(Check my [Portfolio Page](#) for the download link)

This project is utilized for the purpose of registering students.
It is created by using the Graphical User Interface (Tkinter) and using the structured query language to manage where the data will be stored.
It has 2 types of sections of code:

- The Frontend code: Which has the graphical user interface code which creates the labels, buttons, texts or options in which the user reacts with it.
- The Backend code: Which has the structured query language where it creates the database file and stores the data entered through the Tkinter GUI to the database file, it is also used to connect GUI with SQL.

Center Courses
https://github.com/HyperShark25/class.git | ongoing

This is a web application used for Registering, Updating, Reading or Removing Students for a Courses Center, it is built by using Django Framework and has a built-in authentication system which is used to check whether the user has access for this website or not.
